

HW 1 - Warren montes

1.4) Define E = exercise D = ^{drinks} alcohol

$$P(E) = .55 \quad P(D) = .45 \quad P(E \cup D) = .70$$

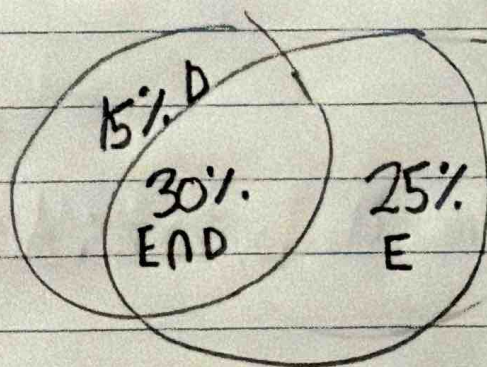

$$P(E \cup D) = P(E) + P(D) - P(E \cap D)$$

$$.70 = 1 - P(E \cap D)$$

$$P(E \cap D) = 0.30 \text{ or } 30\%$$

55% exercise, but 30% drink = 25%

45% Drink, but 30% Exercise = 15%

2. Leaves us w/ 30% of people who do neither
